Experiment 11: Home Finder – Online Real Estate Platform

1. Aim

To design and develop an interactive online real estate website named Home Finder using HTML, CSS, and JavaScript to help buyers and renters search for houses, apartments, land, and commercial properties based on location, budget, property type, and amenities.

2. Procedure

1. Create the HTML structure for the Home Finder website.
2. Design a friendly and responsive user interface using CSS.
3. Develop property listings with images, prices, locations, and amenities.
4. Implement property search and filtering based on location, budget, and type.
5. Create buyer registration and login functionality.
6. Allow users to save search criteria and favourite properties using local storage.
7. Integrate Google Maps links to locate properties and explore neighbourhoods.
8. Add agent and real estate company search functionality.
9. Implement property viewing appointment requests.
10. Develop a mortgage calculator and property valuation tool.
11. Maintain records of website visits and user interactions.
12. Test all functionalities using a web browser.

3. Code Snippet

HTML – Property search form

```
<div class="field">
   <label>Location</label>
   <input id="qLocation"
        placeholder="Enter your location">
</div>
<div class="field">
   <label>Property Type</label>
   <select id="qType">
      <option value="Any">Any Type</option>
      <option>House</option>
      <option>Apartment</option>
```

```
        <option>Villa</option>
        <option>Land</option>
        <option>Commercial</option>
    </select>
</div>
<button class="primary" onclick="searchProperties()">
    Search Properties
</button>
```

JavaScript – Save search criteria

```
function saveSearch() {
    const criteria = {
        purpose: purpose,
        location: document.getElementById("qLocation").value,
        type: document.getElementById("qType").value,
        min: document.getElementById("qMin").value,
        max: document.getElementById("qMax").value
    };

    if (!currentUser) {
        openAuth("login");
        return;
    }

    saved.unshift(criteria);

    localStorage.setItem(
        "hf_saved",
        JSON.stringify(saved)
    );
```

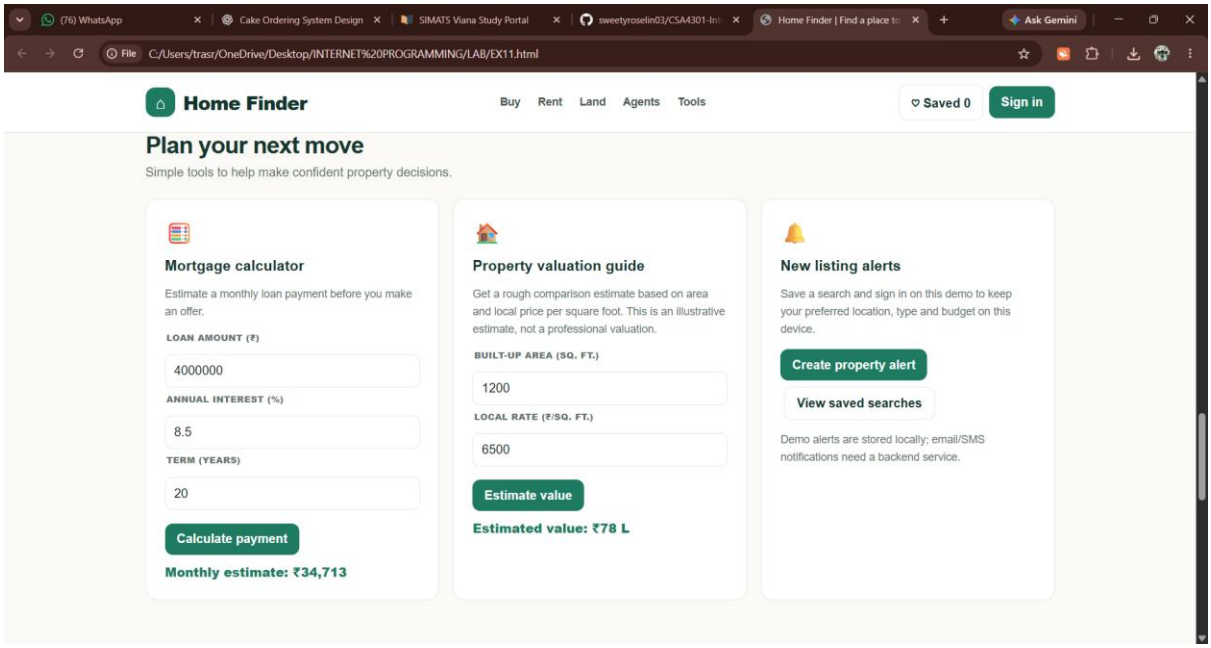

```
    alert("Search saved successfully!");
}
```

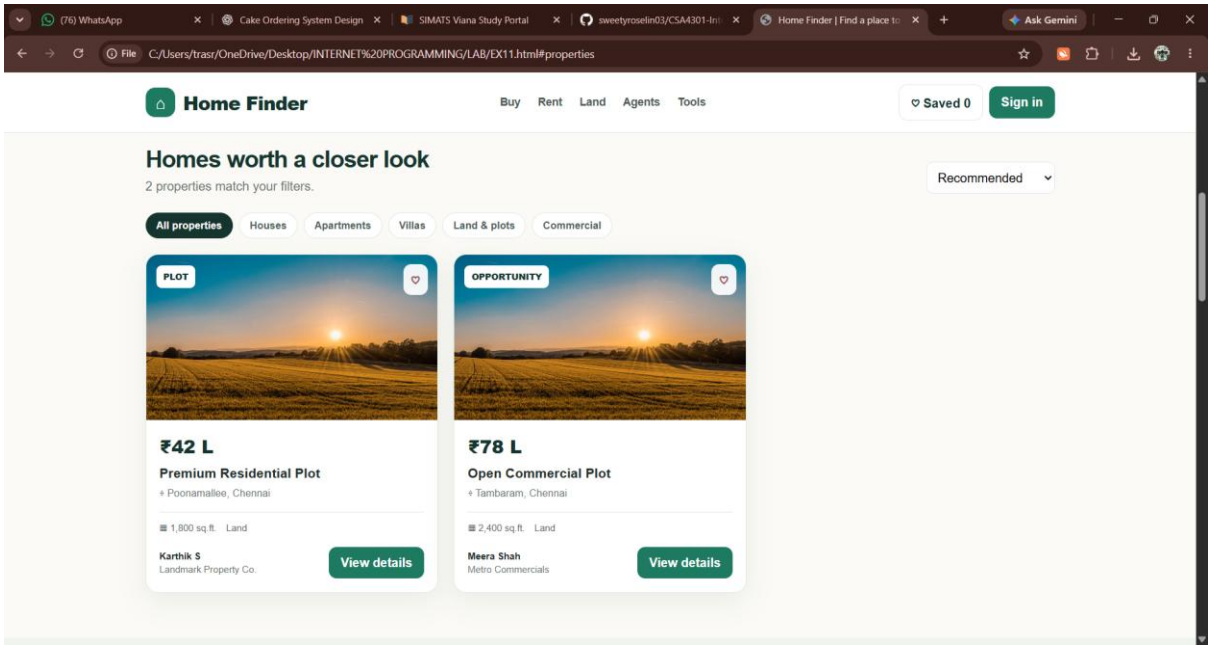

Note: The above snippets demonstrate the search form and saved-search functionality. The complete implementation is available in the Home Finder source code.

4. Output

5. Result

Thus, the Home Finder online real estate website was successfully designed and implemented using HTML, CSS, and JavaScript. It enables users to search for properties according to their location and budget, save their search criteria, explore property locations, contact agents, and request property viewings.
